

SOYBEAN GROWTH MONITORING

WEEK: 07/09 - NORTHEAST - MO

- The rainfall over the last two weeks has brought soil moisture back to high levels, reversing the mild drought stress observed during late June.
- This increased water availability helps initiate seed filling and pod setting in beans planted from April to mid-June in soils with moderate to good drainage. High soil moisture levels also benefit late-planted beans that are still in the vegetative development stage.
- Beans planted in early April have lower yield predictions than those planted in late April or June. The drought stress observed in June impacted early-planted beans during a critical stage. Yields are expected to be higher than in a normal year for all combinations of planting dates and MG in areas not experiencing prolonged soil saturation or flooding.
- Our prediction model is not yet calibrated for oxygen stress.

- **Obs 1:** The 2024 yield prediction is relative to the normal yield of the same maturity group planted on the same date.
- **Obs 2:** *The historical baseline yield is the average from 2019 to 2023 reported by USDA-NASS Survey Program.

The normal growth represents the average growth expected at the reporting date, derived from simulating a current crop variety using 40 years of historical weather data specific to a particular location and planting date.
